

Insert table

- Error

The provided source article ("Buch:User_manual") does not exist.

Wiki code can be very confusing in tables and can take a lot of time and getting used to, particularly when you go into details like editing the colour of a border. However, in the WYSIWYG editor, you can work with tables quickly and easily.

Where can I find the function for inserting tables?

Call up the article you want to edit. Click on "Edit" and change to the WYSIWYG view \checkmark , if you are not already on it ; the table functions are only available in this view. Keep in mind that most of the buttons for table formatting are only active when you have selected a table.

Inserting a table with the WYSIWYG editor

Click on this button \blacksquare to insert a table. Enter the **number of columns and rows** you want. This can, naturally, be easily changed later using the buttons in the WYSIWYG editor. Confirm by left clicking.

In the dropdown menu there are more table functions:

- Table properties
- Delete table
- Cell: Cell properties, merge cells, split cells
- Row: Insert row before/after, delete row, row properties, cut or copy row,

paste row before/after

• Column: Insert column before/after, delete column

Some of these functions you can see as buttons above if the cursors is in a table

If you need more table functions it's also possible to do right clicking.

Using predefined table designs

If you want to create a uniform layout, for example for borders and rules, you should use a **predefined table design**. This will let you edit it as quickly and easily as possible and make the whole wiki homogeneous. You can find the predefined table designs in the WYSIWYG under "formats" Formate - "table":

- **Sorttable** for content which should be sortable by columns.
- Standard: white background
- Content" for normal content (grey background)

Changes like changing the width of tales and cells are, of course, still possible!

Settings affecting the table

Whole table

You can find the table settings in the WYSIWYG function bar above the edit box, but you can also access them by right clicking inside the table. Choose **Table Properties**. You can make all the setting you wish to adjust the table to your wishes.

Note: If you want to export a page that contains a table as a PDF, it is important to first set the table width manually to a maximum of 750px. Only by using this width or smaller can the correct display on the PDF be assured.

General	Advanced
 Width and height can also be defined. If you only put a number in for the width, this will be evaluated as the number of pixels so the table will have this fixed width. If you enter a percent, e.g. 80%, then the table will be adjusted to take up this percentage of the input window. If nothing is entered, then the table width will be set according to the text contents. 'Cell spacing within the cells and the spacing between them. Here, entering small numbers from 2-6px is normally enough. Cell padding Border sets the width of the border. As above, a small number is normally best. If you tick "Table Caption", a caption will be created for the table like those often appearing in scientific texts. Alignment sets the position of the table overall, i.e. if the text should flow around the table to the left or right. 	 Style Define a Border color by clicking on the field on the right side and choosing a color Define a Background color by clicking on the field on the right side and color by clicking on the field on the right side and color by clicking on the field on the right side and choosing a color Color by clicking on the field on the right side and choosing a color Choosing a color Color Color Clicking and Choosing a color Choosing a color Choosing a color Color Color Color Color Color Clicking and Choosing a color Choosing a color Choosing a color Color Color Color Clicking and Choosing a color Clicking and Choosing a color Clicking and Choosing a color Clicking and Clicking and Choosing a color Clicking and Clicking an

Settings for individual table elements

BlueSpíce

If you would still like to create your own table, then you can make the following settings: You can, of course, make settings not just for the whole table, but also for individual cells, rows or columns. To do this, right click on the column, row or cell you want to change. Then choose cell, row or column and then the action you want to take. If you are changing the cell settings, note "scope" at the right hand side of the dialogue. This lets you choose which cells should be affected by the change.

- Cell properties: Width, height, cell typ (cell, header cell), scope and alignment
- Row properties: Row type (body, header, footer), alignemnt and height
- Column properties: Can only be changed in cell properties (use scope "column" or "column group")!

Copying and pasting tables from Excel

BlueSpice lets you copy tables from Excel and paste them in the WYSIWYG editor. If you paste the table into the wiki code directly, then only the text content will be shown. You can then edit the table in the WYSIWYG editor as described above.

Note: Copying and pasting tables from Excel into the wiki works best for simple tables. The height and width of the cells are transferred but not formatting like text colour, background and so on.
