

Reference:Page Forms

Forms for adding and editing semantic data

Use Cases

Use a special Namespace

You can have a page-input form create pages within a specific namespace (like 'User:') by default, without forcing users to type in that namespace every time. To do that, add 'namespace=namespace-name' to the "query string=" parameter.

(Note that, if you want to use SMW on a custom namespace, you need to add the namespace to \$smwgNamespacesWithSemanticLinks.)
