

Reference:BlueSpiceNamespaceCSS

Use different CSS styles for different namespaces. This can be very useful to e.g. distinguish between different manuals or parts of your wiki.

Technical background

Whenever calling up a page in a namespace, the extension **NamespaceCss** sees if you have defined a "CSS-page" for this namespace in the *MediaWiki* namespace. If so, this will then be used as stylesheet.

How does NamespaceCss work?

For each namespace you want to define your own CSS for, you have to create a page in the MediaWiki namespace, using the following template:

```
MediaWiki:NamespaceName_css
```

You can now enter your desired CSS-code directly into this page.

Example: `MediaWiki:User_css` affects all pages in the namespace *User*.

Please note: The *Special* namespace is an exception, as you cannot define a separate CSS for it.

Hint

Make sure that the following code is part of every `MediaWiki:NamespaceName_css` page to ensure that the CSS registers properly. Otherwise the **VisualEditor** might discard your notations:

```
/*  
_NOEDITOR_  
*/
```
