

## Manual:Edit pages

Every existing Wiki-article should be modifiable. You simply switch into edit mode, change the contents in the article and save it. It's that simple! Beside that there are some optional functions, which make working in a wiki easier.

### Edit

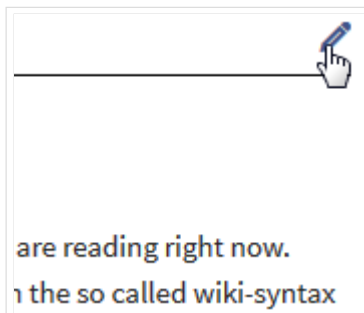

---

To change an article, you first need to switch into the edit mode. There are two options:

Screenshot: Tab for "edit article"

1. With the link **Edit** at the top of every page you can modify the article you are reading right now. After clicking a box of text appears with the complete content of the page in the so called wiki-syntax (normal text with format commands).

Screenshot: edit paragraph

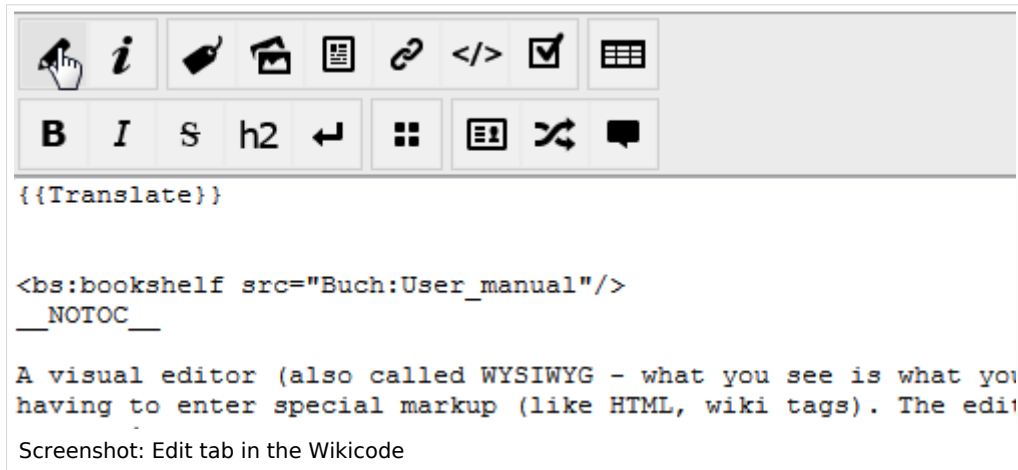

2. Even easier to use are the edit links which are next to the headlines. The text has to be formatted as headline. With those every section can be edited individually. You save time to find the relevant part in the textbox and can modify right away.

## Editing

---

In the edit box you can now modify the article at will, add new or change existing. Above the edit zone an [edit toolbar](#) offers several buttons of the most used Wiki-syntax commands to click.

Beside the Wikisyntax you can also work with the [WYSIWYG-Editor](#); then you don't need the Wiki-toolbar. On the very left side at the top you can find the button to switch to the WYSIWYG-Editor.

## Preview

---

With the button **Show Preview** you can verify if your changes show up to your request. If you scroll down you can still see the edit box. So you can change the article little by little, test it and correct it. When you have finished click **save**. If you keep saving every time you make minor changes this will lead to large entries in the versions history of the article. That's not always useful. The function [SaferEdit](#) saves the article automatically while you are editing at predetermined intervals – so no need to worry, you won't lose your edits.
