

Archive:DataValues Validators

DataValues Validators is a small library that contains common ValueValidator implementations.

Contents

1	Installation	2
2	Composer	2
3	Manual	2
4	Tests	2

Installation

The recommended way to use this library is via [Composer](#).

Composer

To add this package as a local, per-project dependency to your project, simply add a dependency on `data-values/validators` to your project's `composer.json` file. Here is a minimal example of a `composer.json` file that just defines a dependency on version 1.0 of this package:

```
{
    "require": {
        "data-values/validators": "1.0.*"
    }
}
```

Manual

Get the code of this package, either via git, or some other means. Also get all dependencies. You can find a list of the dependencies in the "require" section of the `composer.json` file. Then take care of autoloading the classes defined in the `src` directory.

Tests

This library comes with a set up PHPUnit tests that cover all non-trivial code. You can run these tests using the PHPUnit configuration file found in the root directory. The tests can also be run via TravisCI, as a TravisCI configuration file is also provided in the root directory.
