Archive:DataValues Validators

Extension\: DataValues Validators

Overview		
Description:	Contains common ValueValidator implementations	
State:	stable	**Dependency:** MediaWiki
Developer:	Jeroen De Dauw	**License:** -
Type:		**Category:** Data Analysis
Edition:	BlueSpice pro	
For more info, visit **[Mediawiki].**		

Features

DataValues Validators is a small library that contains common ValueValidator implementations.

Installation

The recommended way to use this library is via Composer.

Composer

To add this package as a local, per-project dependency to your project, simply add a dependency on `data-values/validators` to your project's `composer.json` file. Here is a minimal example of a `composer.json` file that just defines a dependency on version 1.0 of this package:

```
{
    "require": {
        "data-values/validators": "1.0.*"
    }
}
```

Manual

Get the code of this package, either via git, or some other means. Also get all dependencies. You can find a list of the dependencies in the "require" section of the composer.json file. Then take care of autoloading the classes defined in the src directory.

Tests

This library comes with a set up PHPUnit tests that cover all non-trivial code. You can run these tests using the PHPUnit configuration file found in the root directory. The tests can also be run via TravisCI, as a TravisCI configuration file is also provided in the root directory.
