Description

UEModuleDOCX export books to DOCX format.

Usage / Features

This module allows the [UniversalExport](#) wiki article to output as Microsoft Word [Office Open XML](#) . The content is inserted in a user-defined, freely selectable template. The conversion is done via an external tool, which is **subject to license** .

- Conditions:
 - If possible, the conversion should be based on HTML template.
 - CSS / inline-styles should be supported. Here is the floating in pictures a bit critical.
 - Running headers and footers are necessary.
- Images are embedded. Attachments are not possible
 - The template is a docx file. The generated content from the wiki is inserted into the template at the place where the variable "\$ WIKICONTENT \$" is located.
- Meta information is stored in the docx document (author, generator, etc).
- The module works with articles and books.
