

Manual:Extension/DrawioEditor

Summary

The extension **Drawio** offers extensive illustration possibilities for processes, complicated flowcharts, and much more. Descriptive graphics like process chains or decision trees can be constructed easily!

How to create flowcharts with Drawio

Step 1: Create or choose a page where you want to insert a flowchart.

Step 2: Enter the following code at the desired spot:

```
{{#drawio:Name_of_the_flowchart}}
```

Step 3: After saving the article, you will now find an *Edit* link at the respective spot of the page. Click on it to open the creation mode for the flowchart.

In the plugin you can now choose boxes, arrows, etc. on the left and insert and combine it on the right. Clicking **Save** will save your changes and the diagram on your wiki page will be automatically replaced.

By the way: there is also a *Help* tab where you can find a detailed user manual.

You can find more information on the [Drawio homepage](#).

Create links\: Use DrawIO with ImageMap

DrawIO creates a versioned png-file in the *File* namespace. This means that every change of the flowchart that was concluded by *Save* will create a new, updated version of this png-file. You can now integrate this file on another page in your wiki and use ImageMapEdit to link parts of it internally or externally to other pages.

Please note: unfortunately it is not possible to use ImageMapEdit directly with the DrawIO tag in an article, so you will have to create separate pages for this.

More information about the use of ImageMaps can be found [here](#).
