3 Configuration	3

Feedlink erstellen

Use an RSS tag for each feed:

```
<rss max=4 highlight="MediaWiki BlueSpice">https://blog.bluespice.com/feed/</rss>
```

Attributes

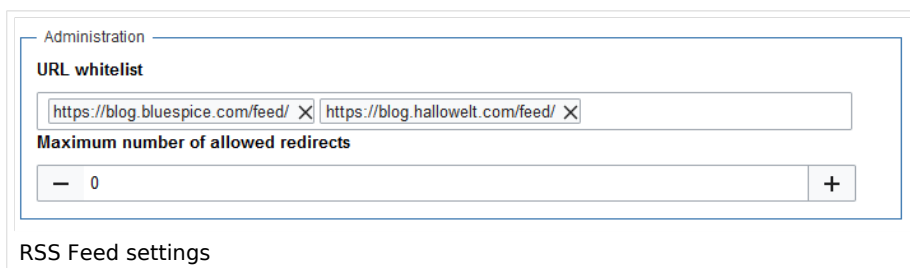

The rss element can contain parameters if you provide them as attributes to the rss element:

attribute	description
<code>template="name"</code>	Encodation of the feed. You need iconv for conversions
<code>item-max-length="1000"</code>	maximum length of text that is shown
<code>date="(Y-m-d H:i:s)"</code>	shows date and time
<code>max="n"</code>	shows at most the given number of elements
<code>highlight="term1 term2 ..."</code>	highlight selected terms in different colours
<code>filter="term1 term2 ..."</code>	show only RSS items with at least one of the terms
<code>filterout="term1 term2 ..."</code>	do not show any RSS item containing any of these terms
<code>reverse</code>	display the RSS items in reverse order

Configuration

Allowed URLs have to be defined in the [configuration manager](#):

- **URL whitelist:** RSS feeds need to be whitelisted here by an administrator before they can be displayed in a wiki page.
- **Maximum number of allowed redirects:** If there are URL redirects for any of the whitelisted URLs, the number of redirects needs to be adjusted (usually to 1 or 2).

The screenshot shows the 'Administration' interface for 'RSS Feed settings'. It features a 'URL whitelist' section with a text input field containing two URLs: 'https://blog.bluespice.com/feed/' and 'https://blog.hallowelt.com/feed/'. Below this is a 'Maximum number of allowed redirects' section with a numeric input field set to '0' and '+' and '-' buttons for adjustment.
