**Memcached is a cache server to improve the performance of your BlueSpice installation. It is not required for the actual operation of BlueSpice. The steps listed here are therefore optional.**

## Installation

---

Install Memcached with Aptitude:

```
apt-get update; \
apt-get -y install memcached; \
apt-get clean
```

## Configuration

---

Open the file containing the memcached configuration (for example, /etc/memcached.conf on Debian / Ubuntu). Find the '-m' argument there and increase the available memory according to your server's capabilities:

```
-m 512
```

Save and close the file and restart memcached with `service memcached restart`.

## Next step

---

If you have completed all steps successfully and want to install BlueSpice pro, proceed to the next step "[Texvc](#)". If you want to install BlueSpice free, you can now continue with [Installing BlueSpice](#).
