Setup:Installation Manual/Security Settings/Deactivating installcheck file

A quality version of this page, approved on *31 July 2017*, was based off this revision.

Contents

This document was created with BlueSpice

As soon as the setup of BlueSpice is completed, you should prevent the execution of the installcheck.php while using the wiki productively.
A short instruction can be found in this document.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g `C:\inetpub\wwwroot\bluespice` (Windows) or `/var/www/bluespice` (Linux).

Deactivating installcheck.php

Switch to the directory `<installpath-bluespice>` and open the `installcheck.php` file in a text editor. Insert a new line after the first line and insert

```
die( 'Deactivated.' );
```

Save and exit the file. The installcheck.php is no longer accessible now.
If you need to restore this file at a later time, it is sufficient to temporarily disable inserted line by placing the # character at the beginning of the line.
